1 GENERAL DESCRIPTION

SSD1683 is an Active Matrix EPD display driver with controller for Red/Black/White EPD displays.

It consists of 400 source outputs, 300 gate outputs, 1 VCOM and 1VBD (for border), which can support displays with resolution up to 400x 300.

In the SSD1683, data and commands are sent from MCU through hardware selectable serial peripheral interface. It has embedded booster, regulator and oscillator which is suitable for EPD display applications.

2 FEATURES

- Design for dot matrix type active matrix EPD display, support Red/Black/White colour
- Resolution: 400 source outputs, 300 gate outputs, 1 VCOM and 1VBD (for border)
- Power supply:
 - VCI: 2.3 to 3.7V
 - VDDIO: Connect to VCI
 - VDD: 1.8V, regulate from VCI supply
- On chip display RAM
 - Mono B/W: 400x300 bits
 - Mono Red: 400x300 bits
- On-chip booster and regulator for generating VCOM, Gate and Source driving voltage
- Gate driving output voltage: 2-level outputs (VGH, VGL), Max 40Vp-p
 - VGH: 10V to 20V (Voltage adjustment step: 500mV)
 - VGL: -VGH (Voltage adjustment step: 500mV)
- Source driving output voltage: 4-levels outputs (VSH1, VSH2, VSS and VSL)
 - VSH1: 8.6V to 17V (Voltage adjustment step: 200mV)
 - VSH2: 2.4V to 17V (Voltage adjustment step: 100mV for 2.4V to 8.6V, 200mV for 8.8V to 17V)
 - VSL: -5V to -17V (Voltage adjustment step: 500mV)
- VCOM output voltage
 - DCVCOM: -3.0V to -0.2V in 100mV resolution
 - ACVCOM: 3-level outputs (VSH1+DCVCOM, DCVCOM, VSL+DCVCOM)
- On-chip oscillator, adjustable frame rate from 25Hz to 125Hz
 - Programmable output Waveform for 3-color mode and black/white mode:
 - 4 LUTs for 3-color mode
 - 5 LUTs for black/white mod
- Embedded OTP to store 24 sets of waveform setting and temperature range, color mode selection, 4-byte waveform version, 10-byte User ID and initial code setting
- External or internal generated voltage for burning OTP
- Built-in CRC checking method for RAM content and WS & TR in OTP
- VCI low voltage detection
- Driving voltage ready detection
- Support display partial update
- Auto write RAM command for regular patterns
- Internal Temperature Sensor of +/-2degC accuracy from -25degC to 50degC
- I2C single master interface to communicate with external temperature sensor
- MCU interface: 4-wire or 3-wire Serial peripheral interface (maximum SPI write speed 20MHz)
- Available in COG package

3 ORDERING INFORMATION

Table 3-1 : Ordering Information

Ordering Part Number	Package Form	Remark
SSD1683Z	Gold Bump Die	Bump Face Up On Waffle pack Die thickness: 300um Bump height: 12um
SSD1683Z8	Gold Bump Die	Bump Face Down On Waffle pack Die thickness: 300um Bump height: 12um

5 PIN DESCRIPTION

Key:

I = Input
 O =Output
 IO = Bi-directional (input/output)
 P = Power pin
 C = Capacitor Pin
 NC = Not Connected

Table 5-1: Power Supply Pins

Name	Type	Connect to	Function	Description	When not in use
VCI	P	Power Supply	Power Supply	Power input pin for the chip.	-
VCIA	P	Power Supply	Power Supply	Power input pin for the chip. - Connect to VCI in the application circuit.	-
VDDIO	P	Power Supply	Power for interface logic pins	Power input pin for the Interface. - Connect to VCI in the application circuit.	-
VDD	P	Capacitor	Regulator output	Core logic power pin VDD can be regulated internally from VCI. A capacitor should be connected between VDD and VSS under all circumstances.	-
VSS	P	VSS	GND	Ground (Digital).	-
VSSA	P	VSS	GND	Ground (Analog) - Connect to VSS in the application circuit.	-
VSSBG	P	VSS	GND	Ground (Reference) pin. - Connect to VSS in the application circuit.	-
VSSGS	P	VSS	GND	Ground (Output) pin. - Connect to VSS in the application circuit.	-
VPP	P	Power Supply	OTP power	Power Supply for OTP Programming.	Open

Table 5-2: Interface Logic Pins

Name	Type	Connect to	Function	Description	When not in use						
SCL	I	MPU	Data Bus	This pin is serial clock pin for interface. Refer to MCU interface in Section 6.1.	-						
SDA	I/O	MPU	Data Bus	This pin is serial data pin for interface. Refer to MCU interface in Section 6.1.	-						
CS#	I	MPU	Logic Control	This pin is the chip select input connecting to the MCU. Refer to MCU interface in Section 6.1.	VDDIO or VSS						
D/C#	I	MPU	Logic Control	This pin is Data/Command control pin connecting to the MCU. Refer to MCU interface in Section 6.1.	VDDIO or VSS						
RES#	I	MPU	System Reset	This pin is reset signal input. Active Low.	-						
BUSY	O	MPU	Device Busy Signal	This pin is Busy state output pin. When Busy is High, the operation of the chip should not be interrupted, and command should not be sent. For example., The chip would output Busy pin as High when - Outputting display waveform; or - Programming with OTP - Communicating with digital temperature sensor	Open						
M/S#	I	VDDIO/VSS	Cascade Mode Selection	This pin is Master and Slave selection pin. - For the single chip application, the M/S# pin should be connected to VDDIO. - In the cascade mode: For Master Chip, the M/S# pin should be connected to VDDIO. For Slave Chip, the M/S# pin should be connected to VSS. The oscillator, booster and regulator circuits of the slave chip will be disabled. The corresponding pins including CL, VDD, VDDIO, VGH, VGL, VSH1, VSH2, VSL and VCOM must be connected to the master chip.	-						
CL	I/O	NC	Clock signal	This pin is the clock signal pin. - For the single chip application, the CL pin should be left open. - In the cascade mode, the CL pin of the slave chip should be connected to the CL pin of the master chip.	-						
BS1	I	VDDIO/VSS	MCU Interface Mode Selection	This pin is for selecting 3-wire or 4-wire SPI bus. <div><table><tr><th>BS1</th><th>MCU Interface</th></tr><tr><td>L</td><td>4-wire SPI</td></tr><tr><td>H</td><td>3-wire SPI (9-bit SPI)</td></tr></table></div>	BS1	MCU Interface	L	4-wire SPI	H	3-wire SPI (9-bit SPI)	-
BS1	MCU Interface										
L	4-wire SPI										
H	3-wire SPI (9-bit SPI)										
TSDA	I/O	Temperature sensor SDA	Interface to Digital Temp. Sensor	This pin is I ² C Interface to digital temperature sensor Data pin. External pull up resistor is required when connecting to I ² C slave.	VSS						
TSCL	O	Temperature sensor SCL	Interface to Digital Temp. Sensor	This pin is I ² C Interface to digital temperature sensor Clock pin. External pull up resistor is required when connecting to I ² C slave.	VSS						

Table 5-3: Analog Pins

Name	Type	Connect to	Function	Description	When not in use
GDR	O	POWER MOSFET Driver Control	VGH, VGL Generation	This pin is N-Channel MOSFET gate drive control pin.	-
RESE	I	Booster Control Input		This pin is Current sense input pin for the control Loop.	-
VGH	C	Stabilizing capacitor		This pin is Positive Gate driving voltage. Connect a stabilizing capacitor between VGH and VSS in the application circuit.	-
VGL	C	Stabilizing capacitor		This pin is Negative Gate driving voltage. Connect a stabilizing capacitor between VGL and VSS in the application circuit.	-
VSH1	C	Stabilizing capacitor	VSH1, VSH2, VSL Generation	This pin is Positive Source driving voltage, VSH1. Connect a stabilizing capacitor between VSH1 and VSS in the application circuit.	-
VSH2	C	Stabilizing capacitor		This pin is Positive Source driving voltage, VSH2. Connect a stabilizing capacitor between VSH2 and VSS in the application circuit.	-
VSL	C	Stabilizing capacitor		This pin is Negative Source driving voltage. Connect a stabilizing capacitor between VSL and VSS in the application circuit.	-
VCOM	C	Panel/ Stabilizing capacitor	VCOM Generation	This pin is VCOM driving voltage. Connect a stabilizing capacitor between VCOM and VSS in the application circuit.	-

Table 5-4: Driver Output Pins

Name	Type	Connect to	Function	Description	When not in use
S [399:0]	O	Panel	Source driving signal	Source output pin.	Open
G [299:0]	O	Panel	Gate driving signal	Gate output pin.	Open
VBD	O	Panel	Border driving signal	Border output pin.	Open

Table 5-5: Miscellaneous Pins

Name	Type	Connect to	Function	Description	When not in use
NC	NC	NC	Not Connected	This is dummy pin. It should not be connected with other NC pins.	Open
RSV	NC	NC	Reserved	This is a reserved pin and should be kept open.	Open
TPA, TPB, TPC, TPD, TPF, FB	NC	NC	Reserved for Testing	Reserved pins. - Keep open. - Do not connect to other NC pins and test pins including TPA, TPB, TPC, TPD, TPF, TIN and FB.	Open
TIN	I	TPE	Reserved for Testing	This is a reserved pin and should be connected to TPE pin	VSS/VDDIO
TPE	O	TIN	Reserved for Testing	This is a reserved pin and should be connected to TIN pin	Open

6 Functional Block Description

6.1 MCU Interface

6.1.1 MCU Interface selection

The SSD1683 can support 3-wire/4-wire serial peripheral. MCU interface is pin selectable by BS1 shown in Table 6-1.

Table 6-1 : Interface pins assignment under different MCU interface

MCU Interface	Pin Name					
	BS1	RES#	CS#	D/C#	SCL	SDA
4-wire serial peripheral interface (SPI)	L	RES#	CS#	DC#	SCL	SDA
3-wire serial peripheral interface (SPI) – 9 bits SPI	H	RES#	CS#	L	SCL	SDA

Note

(1) L is connected to V_{SS} and H is connected to V_{DDIO}

6.1.2 MCU Serial Interface (4-wire SPI)

The 4-wire SPI consists of serial clock SCL, serial data SDA, D/C# and CS#. The control pins status in 4-wire SPI in writing command/data is shown in Table 6-2 and the write procedure 4-wire SPI is shown in Table 6-2

Table 6-2 : Control pins status of 4-wire SPI

Function	SCL pin	SDA pin	D/C# pin	CS# pin
Write command	↑	Command bit	L	L
Write data	↑	Data bit	H	L

Note:

- (1) L is connected to V_{SS} and H is connected to V_{DDIO}
- (2) ↑ stands for rising edge of signal
- (3) SDA (Write Mode) is shifted into an 8-bit shift register on every rising edge of SCL in the order of D7, D6, ... D0. The level of D/C# should be kept over the whole byte. The data byte in the shift register is written to the Graphic Display Data RAM (RAM)/Data Byte register or command Byte register according to D/C# pin.

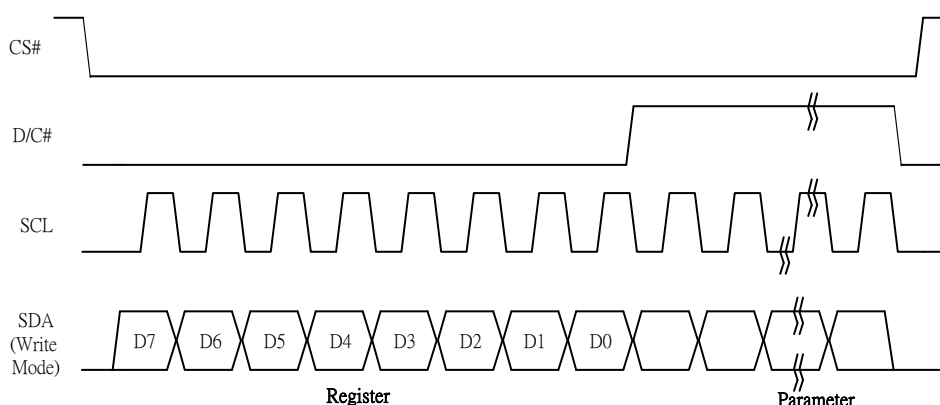

Figure 6-1 : Write procedure in 4-wire SPI mode

In the read operation (Command 0x1B, 0x27, 0x2D, 0x2E, 0x2F, 0x35). After CS# is pulled low, the first byte sent is command byte, D/C# is pulled low. After command byte sent, the following byte(s) read are data byte(s), so D/C# bit is then pulled high. An 8-bit data will be shifted out on every clock falling edge. The serial data SDA bit shifting sequence is D7, D6, to D0 bit. Figure 6-2 shows the read procedure in 4-wire SPI.

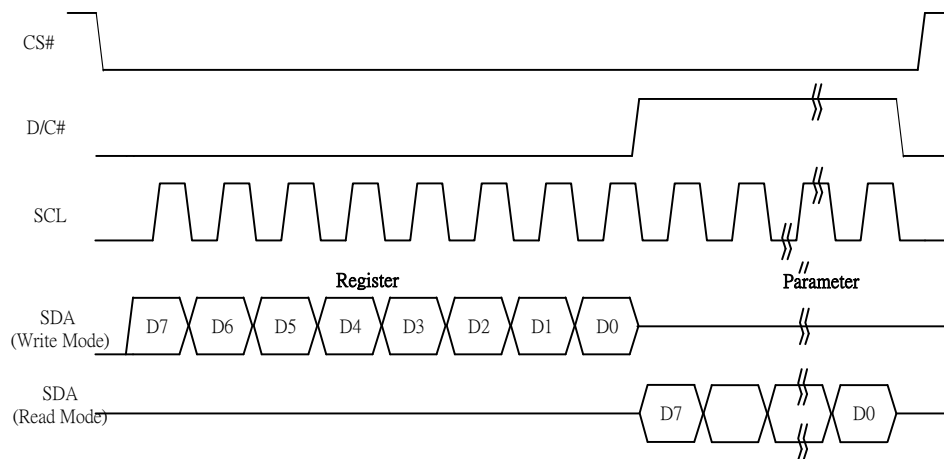

Figure 6-2 : Read procedure in 4-wire SPI mode

6.1.3 MCU Serial Peripheral Interface (3-wire SPI)

The 3-wire SPI consists of serial clock SCL, serial data SDA and CS#. The operation is similar to 4-wire SPI while D/C# pin is not used and it must be tied to LOW. The control pins status in 3-wire SPI is shown in Table 6-3.

In the write operation, a 9-bit data will be shifted into the shift register on every clock rising edge. The bit shifting sequence is D/C# bit, D7 bit, D6 bit to D0 bit. The first bit is D/C# bit which determines the following byte is command or data. When D/C# bit is 0, the following byte is command. When D/C# bit is 1, the following byte is data. Table 6-3 shows the write procedure in 3-wire SPI

Table 6-3 : Control pins status of 3-wire SPI

Function	SCL pin	SDA pin	D/C# pin	CS# pin
Write command	↑	Command bit	Tie LOW	L
Write data	↑	Data bit	Tie LOW	L

Note:

- (1) L is connected to V_{SS} and H is connected to V_{DDIO}
- (2) ↑ stands for rising edge of signal

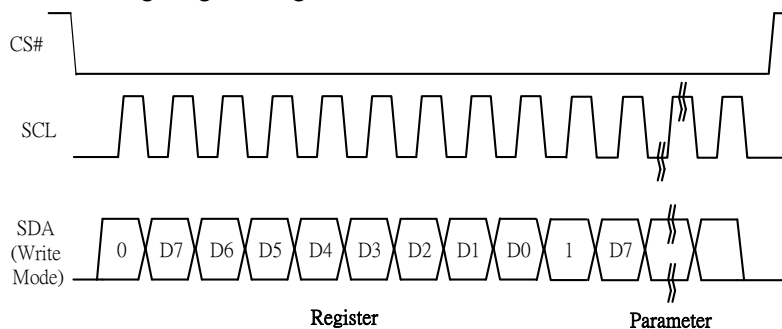

Figure 6-3 : Write procedure in 3-wire SPI

In the read operation (Register 0x1B, 0x27, 0x2D, 0x2E, 0x2F, 0x35). SDA data are transferred in the unit of 9 bits. After CS# pull low, the first byte is command byte, the D/C# bit is as 0 and following with the register byte. After command byte send, the following byte(s) are data byte(s), with D/C# bit is 1. After D/C# bit sending from MCU, an 8-bit data will be shifted out on every clock falling edge. The serial data SDA bit shifting sequence is D7, D6, to D0 bit. Figure 6-4 shows the read procedure in 3-wire SPI.

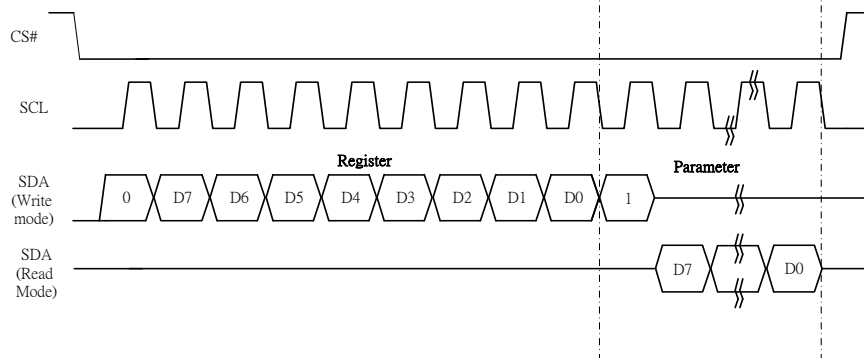

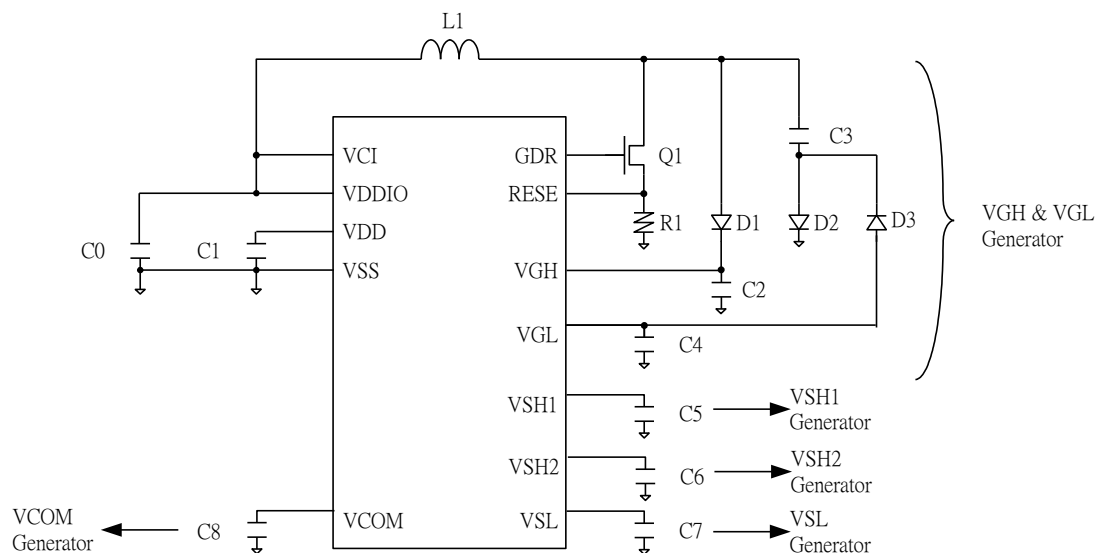

Figure 6-4 : Read procedure in 3-wire SPI mode

6.2 OSCILLATOR

The oscillator module generates the clock reference for waveform timing and analog operations.

6.3 BOOSTER & REGULATOR

A voltage generation system is included in the driver. It provides all necessary driving voltages required for an AMEPD panel including VGH, VGL, VSH1, VSH2, VSL and VCOM. External application circuit is needed to make the on-chip booster & regulator circuit work properly.

6.4 VCOM SENSING

This functional block provides the scheme to select the optimal VCOM DC level. The sensed value can be programmed into OTP.

The flow of VCOM sensing:

- Active Gate is scanning during the VCOM sense Period.
- Source are VSS.
- VCOM pin used for sensing.
- During Sensing period, BUSY is high.
- After Sensing, Active Gate return to non-select stage.

6.5 RAM

The On chip display RAM is holding the image data.

1 set of RAM is built for Mono B/W. The RAM size is 400x300 bits.

1 set of RAM is built for Mono Red. The RAM size is 400x300 bits.

Table 6-4 : RAM bit and LUT mapping for 3-color display

Data bit in R RAM	Data bit in B/W RAM	Image Color	LUT
0	0	Black	LUTB for driving Black
0	1	White	LUTW for driving White
1	0	Red	LUTR for driving Red

Table 6-5 : RAM bit and LUT mapping for black/white display

Data bit in R RAM	Data bit in B/W RAM	Image Color	LUT
0	0	Black	LUTBB for driving Black
0	1	White	LUTWB for driving White
1	0	Black	LUTBW = LUTBB
1	1	White	LUTWW = LUTWB

6.6 Programmable Waveform for Gate, Source and VCOM

There are two selectable programmable driving waveform, which is selected by Command 0x22. The color mode selection can be selected for 3-color mode and black/white mode. Figure 6-5 illustrates the programmable driving waveform with the description of parameter setting.

Figure 6-5 : Programmable driving waveform illustration

In 3-color mode, there are 8 groups (Group0 to Group7) for 4 LUTs. The 4 LUTs are LUTC, LUTR, LUTW and LUTB. In black/white mode, there are 6 groups (Group0 to Group5) for 5LUTs. The 5 LUTs are LUTC, LUTBB, LUTWB, LUTBW and LUTWW. In each group, there are 4 phases (Phase A to Phase D) and 2 state repeats (Phase A and B, Phase C and D). Totally, there are 32 phases in 3-color mode and 24 phases in black/white mode. In each phase, the phase length (TP[nX]) can be set by number of frame from 0 to 63 frames. Also, each group can be repeated with repeat counting number (RP[n]) from 0 to 255 times; each AB / CD phases can be repeated with state repeat counting number (SR[nAB]/SR[nCD]) from 0 to 255 times. For the voltage level (VS[nX-LUTm]), there are four levels for Source voltage (VSS, VSH1, VSH2, VSL) and four levels for VCOM voltage (DCVCOM, VSH1+DCVCOM, VSL+DCVCOM, Floating).

The description of each parameter is as follows.

- 1) TP[nX] represents the phase length set by the number of frame.
 - The range of TP[nX] is from 0 to 63.
 - n represents the Group number
 - from 0 to 7 for 3-color mode
 - from 0 to 5 for black/white mode
 - X represents the phase number from A to D.
 - When TP[nX] = 0, the phase is skipped. When TP[nX] = 1, the phase is 1 frame, and so on. The maximum phase length is 63 frame.
- 2) RP[n] represents the repeat counting number for the Group.
 - The range of RP[n] is from 0 to 255.
 - n represents the Group number
 - from 0 to 7 for 3-color mode
 - from 0 to 5 for black/white mode
 - RP[n] = 0 indicates that the group is skipped, RP[n] = 1 indicates that the repeat times = 1, and so on. The maximum repeat times is 255.
- 3) SR[nAB] and SR[nCD] represent the state repeat counting number for Phase A & B and Phase C & D respectively.
 - The range of SR[nXY] is from 0 to 255.
 - n represents the Group number
 - from 0 to 7 for 3-color mode
 - from 0 to 5 for black/white mode
 - SR[nXY] = 0 indicates that the sub-group is skipped, SR[nXY] = 1 indicates that the repeat times = 1, and so on. The maximum repeat times is 255.
- 4) VS[nX-LUTm] represents Source and VCOM voltage level which is used in each phase. Table 6-6 shows the voltage settings for source voltage and VCOM voltage.
 - In 3-color mode
 - n represents the Group number from 0 to 7.
 - X represents the phase number from A to D.
 - LUTm represents the corresponding LUT for LUTC, LUTB, LUTW and LUTR.
 - In black/white mode
 - n represents the Group number from 0 to 5.
 - X represents the phase number from A to D.
 - LUTm represents the corresponding LUT for LUTC, LUTBB, LUTWB, LUTBW and LUTWW.

Table 6-6 : VS[nX-LUTm] settings for Source voltage and VCOM voltage

VS[nX-LUTm]	Source voltage	VCOM voltage
00	VSS	DCVCOM
01	VSH1	VSH1 + DCVCOM
10	VSL	VSL + DCVCOM
11	VSH2	Floating

5) FR indicates the frame rate for display. Table 6-7 shows the FR settings for frame rate selection.

Table 6-7 : FR settings for frame rate selection

FR[3:0]	Frame Rate	FR[3:0]	Frame Rate
0001	25Hz	1001	37.5Hz
0010	50Hz	1010	62.5Hz
0011	75Hz	1011	87.5Hz
0100	100Hz	1100	112.5Hz
0101	125Hz		

6) XON[nAB] and XON[nCD], indicates the gate scan selection.

- n represents the Group number
 - from 0 to 7 for 3-color mode
 - from 0 to 5 for black/white mode
- XON[nXY] = 0 indicates Normal gate scan in Phase[nX] & Phase[nY].
- XON[nXY] = 1 indicates All gate on, that Gate keeps High until the phase for normal gate scan, in Phase[nX] & Phase[nY].

7) EOPT represents Display off sequence.

- Set as 0x22 for
 - 2 scan frames to discharge TFT pixels voltage
 - VCOM and HV power will be discharged in a sequence.
 - Set as 0x07 for
 - No scan frame, keep previous TFT pixels voltage
 - VCOM will float. VSH1/VSH2/VSL/VGH will be discharged & VGL will float in a sequence
- For 0x07 setting, VCOM and VGL are floating after display update. Please wait until the system completely discharge before next operation.

8) VGH, VSH1/ VSH2/ VSL and VCOM represent the gate driving voltage, source driving voltage and VCOM driving voltage respectively.

- VGH setting from 10V to 20V.
- VSH1 voltage setting from 8.6V to 17V.
- VSH2 voltage setting from 2.4V to 8.6V, 8.8V to 17V
- VSL setting from -5V to -17V.
- VCOM setting from -0.2V to -3V.

6.7 WAVEFORM SETTING

As described in Section 6.6, parameters VS[nX-LUTm], TP[nX], RP[n], SR[nXY], FR[n], and XON[nXY], EOPT and VGH, VSH1/ VSH2/ VSL, VCOM are used to define the driving waveform. In the SSD1683, there are 233 bytes in the waveform setting as follows.

- WS byte 0~226, the content of waveform LUT are defined by Register 0x32
- WS byte 227, the content of display off sequence, is the parameter belonging to register 0x3F.
- WS byte 228, the content of gate level, is the parameter defined by Register 0x03.
- WS byte 229~231, the content of source level, is the parameter defined by Register 0x04.
- WS byte 232, the content of VCOM level, is the parameter defined by Register 0x2C.

Figure 6-6 and Figure 6-7 show the waveform setting format for 3-color mode and black/white mode respectively. The waveform setting of a particular temperature range can be loaded from OTP or written by MCU. These commands (0x32, 0x3F, 0x03, 0x04 and 0x2C) can be overridden by the latest register setting. For example, if waveform setting A is loaded from OTP first, then, MCU has written another waveform setting B into the driver IC after OTP loaded. The driver IC will use the waveform setting B to drive the display.

6.8 Temperature Searching

The SSD1683 has internal temperature sensor to detect the environment temperature or can communicate with the external temperature sensor by I2C single master interface or can communicate with the external MCU to get the temperature value through SPI. In the SSD1683, there is a dedicated format for the temperature value so that the driver IC can understand it. The format of temperature value is described in Section 6.8.3.

6.8.1 Internal Temperature Sensor

The internal temperature sensor can be selected by command register. The accuracy of it is $\pm 2^{\circ}\text{C}$ from -25°C to 50°C .

6.8.2 External Temperature Sensor I2C Single Master Interface

The driver IC can communicate with the external temperature sensor through I2C single master interface (TSDA and TSCL). TSDA will be SDA and TSCL will be SCL. TSDA and TSCL are required to connect with external pull-up resistor. Temperature register value of external temperature sensor can be read by command register.

6.8.3 Format of temperature value

The temperature value is defined by 8-bit binary. The rules are shown as below.

- If the Temperature value MSByte bit D11 = 0, then the temperature is positive and value (DegC) = + (Temperature value)
- If the Temperature value MSByte bit D11 = 1, then the temperature is negative and value (DegC) = - (2's complement of Temperature value)

Table 6-8 shows some examples of 8-bit binary temperature value:

Table 6-8 : Example of 8-bit binary temperature settings for temperature ranges

8-bit binary (2's complement)	Hexadecimal Value	TR Value [DegC]
0111 1111	7F	12B
0110 0100	64	100
0101 0000	50	80
0100 1011	4B	75
0011 0010	32	50
0001 1001	19	25
0000 0000	00	0
1111 1111	FF	-1
1110 0111	E7	-25
1100 1001	C9	-55

6.9 Waveform Setting searching mechanism

As mentioned in Section 6.7, the SSD1683 OTP can store waveform setting and temperature range. If waveform setting and temperature range are programmed in OTP memory, corresponding waveform LUT can be selected according to the sensed temperature to drive the display. The Waveform Setting searching mechanism by driver IC is as follows.

- 1) Read temperature value by command register in the format of 8-bit binary.
- 2) According to read temperature and color mode selection, search LUT in OTP from TR0 to TR23 in sequence. The last match will be selected, then, the corresponding WS will be loaded in the LUT register to drive the display.

Remark: Waveform LUT selection criteria is “Lower temperature bound < Sensed temperature ≤ Upper temperature bound”.

Table 6-9 shows an example for the waveform LUT searching from OTP:

- If the read temperature is 25degC, then, WS4 will be selected.
- If the read temperature is 34degC, then, WS7 will be selected. Although 34degC is also in the temperature range TR6, according to searching mechanism, the last match should be selected. Therefore, WS7 is selected.

Table 6-9 : Example of waveform settings selection based on temperature ranges.

Waveform LUT in OTP	Temperature Range in OTP	TR Lower Limit [Hex]	TR Upper Limit [Hex]	Temperature range in OTP
WS0	TR0	80	05	-128 DegC < Temperature ≤ 5 DegC
WS1	TR1	05	0A	5 DegC < Temperature ≤ 10DegC
WS2	TR2	0A	0F	10 DegC < Temperature ≤ 15DegC
WS3	TR3	0F	14	15 DegC < Temperature ≤ 20DegC
WS4	TR4	14	19	20 DegC < Temperature ≤ 25DegC
WS5	TR5	19	1E	25 DegC < Temperature ≤ 30DegC
WS6	TR6	1E	23	30 DegC < Temperature ≤ 35DegC
WS7	TR7	21	7F	33 DegC < Temperature ≤ 127DegC
Others	Others	00	00	

Precaution:

Please ensure the temperature range covers whole range of application temperatures, display will not be updated if no suitable temperature range matches the sensed temperature.

6.10 One Time Programmable (OTP) Memory

In the SSD1683, there is an embedded OTP memory which is designed to store the waveform settings of different temperature range and some variables/parameters. The OTP memory can store 24 sets of waveform LUT settings (WS), 24 sets of temperature range (TR), VCOM value, color mode selection, waveform version and user ID. Figure 6 7 shows the address mapping of the 24 waveform setting (WS0 to WS23) and temperature range (TR0 to TR23).

Figure 6-8 : The Waveform setting mapping in OTP for waveform setting and temperature range

6.11 The Format for Temperature Range (TR)

The format of TR Lower limit and Upper limit as shown in Figure 6-8 which temp_L[7:0] is the lower limit and temp_H[7:0] is the upper limit of the temperature range. There has 24sets of TR for waveform LUT searching.

Figure 6-9 : Format of Temperature Range (TR) in OTP

6.12 Cascade Mode

The SSD1683 has a cascade mode that can cascade 2 chips to achieve the display resolution up to 800 (sources) x 300 (gates). The pin M/S# is used to configure the chip. When M/S# is connected to VDDIO, the chip is configured as a master chip. When M/S# is connected to VSS, the chip is configured as a slave chip.

When the chip is configured as a master chip, it will be the same as a single chip application, ie, all circuit blocks will be worked as usual. When the chip is configured as a slave chip, its oscillator and booster & regulator circuit will be disabled. The oscillator clock and all booster voltages will be come from the master chip. Therefore, the corresponding pins including CL, VDD, VGH, VGL, VSH1, VSH2, VSL, VGL and VCOM must be connected to the master chip.

6.13 VCI Detection

The VCI detection function is used to detect the VCI level when it is lower than Vlow, threshold voltage set by register.

In SSD1683, there is a command to execute the VCI detection function. When the VCI detection command is issued, the VCI detection will be executed. During the detection period, BUSY output is at high level. BUSY output is at low level when the detection is completed. Then, user can issue the Status Bit Read command to check the status bit for the result of VCI, which 0 is normal, 1 is VCI<Vlow.

6.14 HV Ready Detection

The HV Ready detection function is used to detect whether the analog block is ready.

In SSD1683, there is a command to execute the HV Ready detection function. When the HV Ready detection command is issued, the HV Ready will be executed. During the detection period, BUSY output is at high level. BUSY output is at low level when the detection is completed. Then, user can issue the Status Bit Read command to check the status bit for the result of HV Ready, which 0 is normal, 1 indicate HV is not ready.

8 COMMAND DESCRIPTION

8.1 Driver Output Control (01h)

This triple byte command has multiple configurations and each bit setting is described as follows:

R/W	DC	IB7	IB6	IB5	IB4	IB3	IB2	IB1	IB0
W	1	MUX7	MUX6	MUX5	MUX4	MUX3	MUX2	MUX1	MUX0
	POR	0	0	1	0	1	0	1	1
W	1								MUX8
	POR								1
W	1						GD	SM	TB
	POR						0	0	0

MUX[8:0]: Specify number of lines for the driver: MUX[8:0] + 1. Multiplex ratio (MUX ratio) from 16 MUX to 300MUX.

GD: Selects the 1st output Gate

This bit is made to match the GATE layout connection on the panel. It defines the first scanning line.

SM: Change scanning order of gate driver.

When SM is set to 0, left and right interlaced is performed.

When SM is set to 1, no splitting odd / even of the GATE signal is performed,

Output pin assignment sequence is shown as below (for 300 MUX ratio):

	SM=0	SM=0	SM=1	SM=1
Driver	GD=0	GD=1	GD=0	GD=1
G0	ROW0	ROW1	ROW0	ROW150
G1	ROW1	ROW0	ROW150	ROW0
G2	ROW2	ROW3	ROW1	ROW151
G3	ROW3	ROW2	ROW151	ROW1
:	:	:	:	:
G148	ROW148	ROW149	ROW74	ROW224
G149	ROW149	ROW148	ROW224	ROW74
G150	ROW150	ROW151	ROW75	ROW225
G151	ROW151	ROW150	ROW225	ROW75
:	:	:	:	:
G296	ROW296	ROW297	ROW148	ROW298
G297	ROW297	ROW296	ROW298	ROW148
G298	ROW298	ROW299	ROW149	ROW299
G299	ROW299	ROW298	ROW299	ROW149

See "Scan Mode Setting" on next page.

TB: Change scanning direction of gate driver.

This bit defines the scanning direction of the gate for flexible layout of signals in module either from up to down (TB = 0) or from bottom to up (TB = 1).

Figure 8-1: Output pin assignment on different Scan Mode Setting

8.2 Data Entry Mode Setting (11h)

This command has multiple configurations and each bit setting is described as follows:

R/W	DC	IB7	IB6	IB5	IB4	IB3	IB2	IB1	IB0
W	1						AM	ID1	ID0
POR		0	0	0	0	0	0	1	1

ID[1:0]: The address counter is automatically incremented by 1, after data is written to the RAM when ID[1:0] = “01”. The address counter is automatically decremented by 1, after data is written to the RAM when ID[1:0] = “00”. The setting of incrementing or decrementing of the address counter can be made independently in each upper and lower bit of the address. The direction of the address when data is written to the RAM is set by AM bits.

AM: Set the direction in which the address counter is updated automatically after data are written to the RAM. When AM = “0”, the address counter is updated in the X direction. When AM = “1”, the address counter is updated in the Y direction. When window addresses are selected, data are written to the RAM area specified by the window addresses in the manner specified with ID[1:0] and AM bits.

	ID [1:0]="00" X: decrement Y: decrement	ID [1:0]="01" X: increment Y: decrement	ID [1:0]="10" X: decrement Y: increment	ID [1:0]="11" X: increment Y: increment
AM="0" X-mode	00,00h 31,12Bh	00,00h 31,12Bh	00,00h 31,12Bh	00,00h 31,12Bh
AM="1" Y-mode	00,00h 31,12Bh	00,00h 31,12Bh	00,00h 31,12Bh	00,00h 31,12Bh

The pixel sequence is defined by the ID [0],

	ID[1:0]="00" X: decrement Y: decrement	ID[1:0]="01" X: increment Y: decrement
AM="0" X-mode	00,00h 4, 3, 2, 1	00,00h 1, 2, 3, 4
31,12Bh		

8.3 Set RAM X - Address Start / End Position (44h)

R/W	DC	IB7	IB6	IB5	IB4	IB3	IB2	IB1	IB0
W	1			XSA5	XSA4	XSA3	XSA2	XSA1	XSA0
POR		0	0	0	0	0	0	0	0
W	1			XEA5	XEA4	XEA3	XEA2	XEA1	XEA0
POR		0	0	1	1	0	0	0	1

XSA[5:0]/XEA[5:0]: Specify the start/end positions of the window address in the X direction by 8 times address unit. Data is written to the RAM within the area determined by the addresses specified by XSA [5:0] and XEA [5:0]. These addresses must be set before the RAM write.

It allows on $XEA [5:0] \leq XSA [5:0]$. The settings follow the condition on $00h \leq XSA [5:0]$, $XEA [5:0] \leq 31h$. The windows is followed by the control setting of Data Entry Setting (R11h)

8.4 Set RAM Y - Address Start / End Position (45h)

R/W	DC	IB7	IB6	IB5	IB4	IB3	IB2	IB1	IB0
W	1	YSA7	YSA6	YSA5	YSA4	YSA3	YSA2	YSA1	YSA0
POR		0	0	0	0	0	0	0	0
W	1	0	0	0	0	0	0	0	YSA8
POR		0	0	0	0	0	0	0	0
W	1	YEA7	YEA6	YEA5	YEA4	YEA3	YEA2	YEA1	YEA0
POR		0	0	1	0	1	0	1	1
W	1	0	0	0	0	0	0	0	YEA8
POR		0	0	0	0	0	0	0	1

YSA[8:0]/YEA[8:0]: Specify the start/end positions of the window address in the Y direction by an address unit. Data is written to the RAM within the area determined by the addresses specified by YSA [8:0] and YEA [8:0]. These addresses must be set before the RAM write.

It allows $YEA [8:0] \leq YSA [8:0]$. The settings follow the condition on $00h \leq YSA [8:0]$, $YEA [8:0] \leq 12Bh$. The windows is followed by the control setting of Data Entry Setting (R11h)

8.5 Set RAM Address Counter (4Eh-4Fh)

Reg#	R/W	DC	IB7	IB6	IB5	IB4	IB3	IB2	IB1	IB0
4Eh	W	1			XAD5	XAD4	XAD3	XAD2	XAD1	XAD0
	POR		0	0	0	0	0	0	0	0
4Fh	W	1	YAD7	YAD6	YAD5	YAD4	YAD3	YAD2	YAD1	YAD0
	POR		0	0	0	0	0	0	0	0
	W	1								YAD8
	POR									0

XAD[5:0]: Make initial settings for the RAM X address in the address counter (AC).

YAD[8:0]: Make initial settings for the RAM Y address in the address counter (AC).

After RAM data is written, the address counter is automatically updated according to the settings with AM, ID bits and setting for a new RAM address is not required in the address counter. Therefore, data is written consecutively without setting an address. The address counter is not automatically updated when data is read out from the RAM. RAM address setting cannot be made during the standby mode. The address setting should be made within the area designated with window addresses which is controlled by the Data Entry Setting (R11h) {AM, ID[1:0]} ; RAM Address XStart / XEnd Position (R44h) and RAM Address Ystart /Yend Position (R45h). Otherwise undesirable image will be displayed on the Panel.

9 Operation Flow and Code Sequence

In this section, two SSD1683 operation flows with loading waveform LUT from OTP are introduced. The flows are shown in section 9.1 and section 9.2.

9.1 SSD1683 operation flow to drive display panel with power on/off

Figure 9-1 shows the SSD1683 operation flow to drive display panel with power on and off. In this flow, the driver IC will be off after display panel is update.

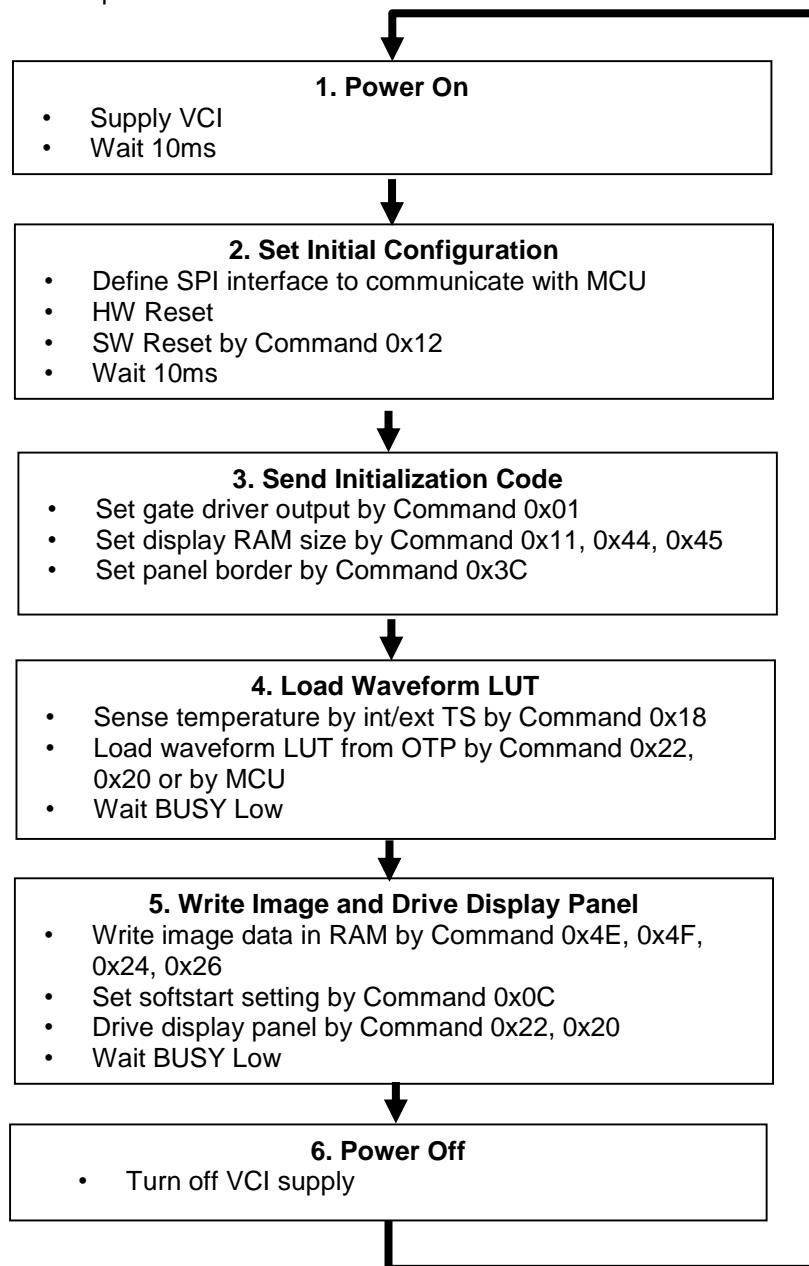

Figure 9-1: Operation flow to drive display panel power on/off

9.2 SSD1683 operation flow to enter deep sleep mode 2 after display update

Figure 9-2 shows the SSD1683 operation flow to enter deep sleep mode2 after display update. In this flow, the driver IC will enter the deep sleep mode 2 after display update.

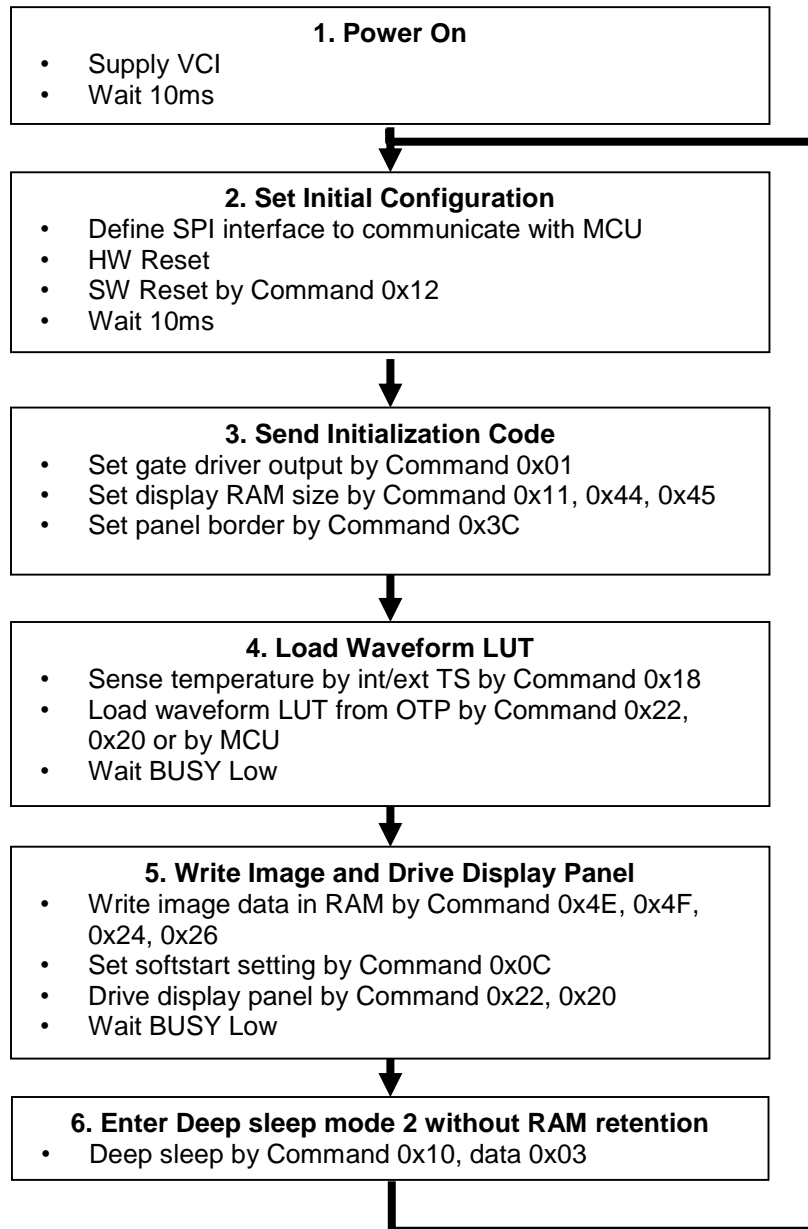

Figure 9-2: Operation flow to enter deep sleep mode 2 after display update

10 Absolute Maximum Rating

Table 10-1 : Maximum Ratings

Symbol	Parameter	Rating	Unit
V _{CI}	Logic supply voltage	-0.5 to +6.0	V
V _{IN}	Logic Input voltage	-0.5 to V _{DDIO} +0.5	V
V _{OUT}	Logic Output voltage	-0.5 to V _{DDIO} +0.5	V
T _{OPR}	Operation temperature range	-40 to +85	°C
T _{STG}	Storage temperature range	-65 to +150	°C

Maximum ratings are those values beyond which damages to the device may occur. Functional operation should be restricted to the limits in the Electrical Characteristics tables or Pin Description section

This device contains circuitry to protect the inputs against damage due to high static voltages or electric fields; however, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum rated voltages to this high impedance circuit. For proper operation it is recommended that V_{CI} be constrained to the range V_{SS} < V_{CI}. Reliability of operation is enhanced if unused input is connected to an appropriate logic voltage level (e.g., either V_{SS} or V_{DDIO}). Unused outputs must be left open. This device may be light sensitive. Caution should be taken to avoid exposure of this device to any light source during normal operation. This device is not radiation protected.

11 Electrical Characteristics

The following specifications apply for: V_{SS}=0V, V_{CI}=3.0V, V_{DD}=1.8V, T_{OPR}=25°C.

Table 11-1: DC Characteristics

Symbol	Parameter	Applicable pin	Test Condition	Min.	Typ.	Max.	Unit
V _{CI}	V _{CI} operation voltage	V _{CI}	-	2.3	3.0	3.7	V
V _{DD}	V _{DD} operation voltage	V _{DD}	-	1.7	1.8	1.9	V
V _{COM_DC}	V _{COM_DC} output voltage	V _{COM}	-	-3.0	-	-0.2	V
dV _{COM_DC}	V _{COM_DC} output voltage deviation	V _{COM}	-	-200	-	200	mV
V _{COM_AC}	V _{COM_AC} output voltage	V _{COM}	-	V _{SL} + V _{COM_DC}	V _{COM_DC}	V _{SH1} + V _{COM_DC}	V
V _{GATE}	Gate output voltage	G0~G299	-	-20	-	+20	V
V _{GATE(p-p)}	Gate output peak to peak voltage	G0~G299	-	-	-	40	V
V _{SH1}	Positive Source output voltage	V _{SH1}	-	+8.6	+15	+17	V
dV _{SH1}	V _{SH1} output voltage deviation	V _{SH1}	From 8.6V to 17V	-200	-	200	mV
V _{SH2}	Positive Source output voltage	V _{SH2}	-	+2.4	+5	+17	V
dV _{SH2}	V _{SH2} output voltage deviation	V _{SH2}	From 2.4V to 8.6V	-100	-	100	mV
			From 8.8V to 17V	-200	-	200	mV
V _{SL}	Negative Source output voltage	V _{SL}	-	-17	-15	-5.0	V
dV _{SL}	V _{SL} output voltage deviation	V _{SL}	-	-200	-	200	mV
V _{IH}	High level input voltage	SDA, SCL, CS#, D/C#, RES#, BS1, M/S#, CL	-	0.8V _{DDIO}	-	-	V
V _{IL}	Low level input voltage		-	-	-	0.2V _{DDIO}	V
V _{OH}	High level output voltage	SDA, BUSY, CL	I _{OH} = -100uA	0.9V _{DDIO}	-	-	V
V _{OL}	Low level output voltage		I _{OL} = 100uA	-	-	0.1V _{DDIO}	V
V _{PP}	OTP Program voltage	V _{PP}	-	7.25	7.5	7.75	V

Symbol	Parameter	Applicable pin	Test Condition	Min.	Typ.	Max.	Unit
IsIp_VCI	Sleep mode current	VCI	- DC/DC off - No clock - No output load - MCU interface access - RAM data access	-	25	35	uA
Idslp_VCI1	Current of deep sleep mode 1	VCI	- DC/DC off - No clock - No output load - No MCU interface access - Retain RAM data but cannot access the RAM	-	3	5	uA
Idslp_VCI2	Current of deep sleep mode 2	VCI	- DC/DC off - No clock - No output load - No MCU interface access - Cannot retain RAM data	-	1	4	uA
Iopr_VCI	Operating Mode current	VCI	VCI=3.0V	-	1000	-	uA
V _{GH}	Operating Mode Output Voltage	VGH	Enable Clock and Analog by Master Activation Command	19.5	20	20.5	V
V _{SH1}		VSH1	VGH=20V VGL=-VGH	14.8	15	15.2	V
V _{SH2}		VSH2	VSH1=15V VSH2=5V	4.9	5	5.1	V
V _{SL}		VSL	VSL=-15V VCOM = -2V	-15.2	-15	-14.8	V
V _{COM}		VCOM	No waveform transitions. No loading. No RAM read/write No OTP read /write	-2.2	-2	-1.8	V

Table 11-2: Regulators Characteristics

Symbol	Parameter	Test Condition	Applicable pin	Min.	Typ.	Max.	Unit
IVSH	VSH1 current	VSH1 = +15V	VSH1	-	-	800	uA
IVSH1	VSH2 current	VSH2 = +5V	VSH2	-	-	800	uA
IVSL	VSL current	VSL = -15V	VSL	-	-	800	uA
IVCOM	VCOM current	VCOM = -2V	VCOM	-	-	100	uA

12 AC Characteristics

12.1 Serial Peripheral Interface

The following specifications apply for: VDDIO - VSS = 2.3V to 3.7V, T_{OPR} = 25°C, CL=20pF

Table 12-1 : Serial Peripheral Interface Timing Characteristics

Write mode

Symbol	Parameter	Min	Typ	Max	Unit
f _{SCL}	SCL frequency (Write Mode)	-	-	20	MHz
t _{CSSU}	Time CS# has to be low before the first rising edge of SCLK	60	-	-	ns
t _{CSHLD}	Time CS# has to remain low after the last falling edge of SCLK	60	-	-	ns
t _{CSHIGH}	Time CS# has to remain high between two transfers	100	-	-	ns
t _{SCLHIGH}	Part of the clock period where SCL has to remain high	25	-	-	ns
t _{SCLLOW}	Part of the clock period where SCL has to remain low	25	-	-	ns
t _{SISU}	Time SI (SDA Write Mode) has to be stable before the next rising edge of SCL	10	-	-	ns
t _{SIHLD}	Time SI (SDA Write Mode) has to remain stable after the rising edge of SCL	40	-	-	ns

Read mode

Symbol	Parameter	Min	Typ	Max	Unit
f _{SCL}	SCL frequency (Read Mode)	-	-	2.5	MHz
t _{CSSU}	Time CS# has to be low before the first rising edge of SCLK	100	-	-	ns
t _{CSHLD}	Time CS# has to remain low after the last falling edge of SCLK	50	-	-	ns
t _{CSHIGH}	Time CS# has to remain high between two transfers	250	-	-	ns
t _{SCLHIGH}	Part of the clock period where SCL has to remain high	180	-	-	ns
t _{SCLLOW}	Part of the clock period where SCL has to remain low	180	-	-	ns
t _{SOSU}	Time SO(SDA Read Mode) will be stable before the next rising edge of SCL	-	50	-	ns
t _{SOHLD}	Time SO (SDA Read Mode) will remain stable after the falling edge of SCL	-	0	-	ns

Note: All timings are based on 20% to 80% of VDDIO-VSS

Figure 12-1: SPI timing diagram

13 Application Circuit

Figure 13-1: Schematic of SSD1683 application circuit

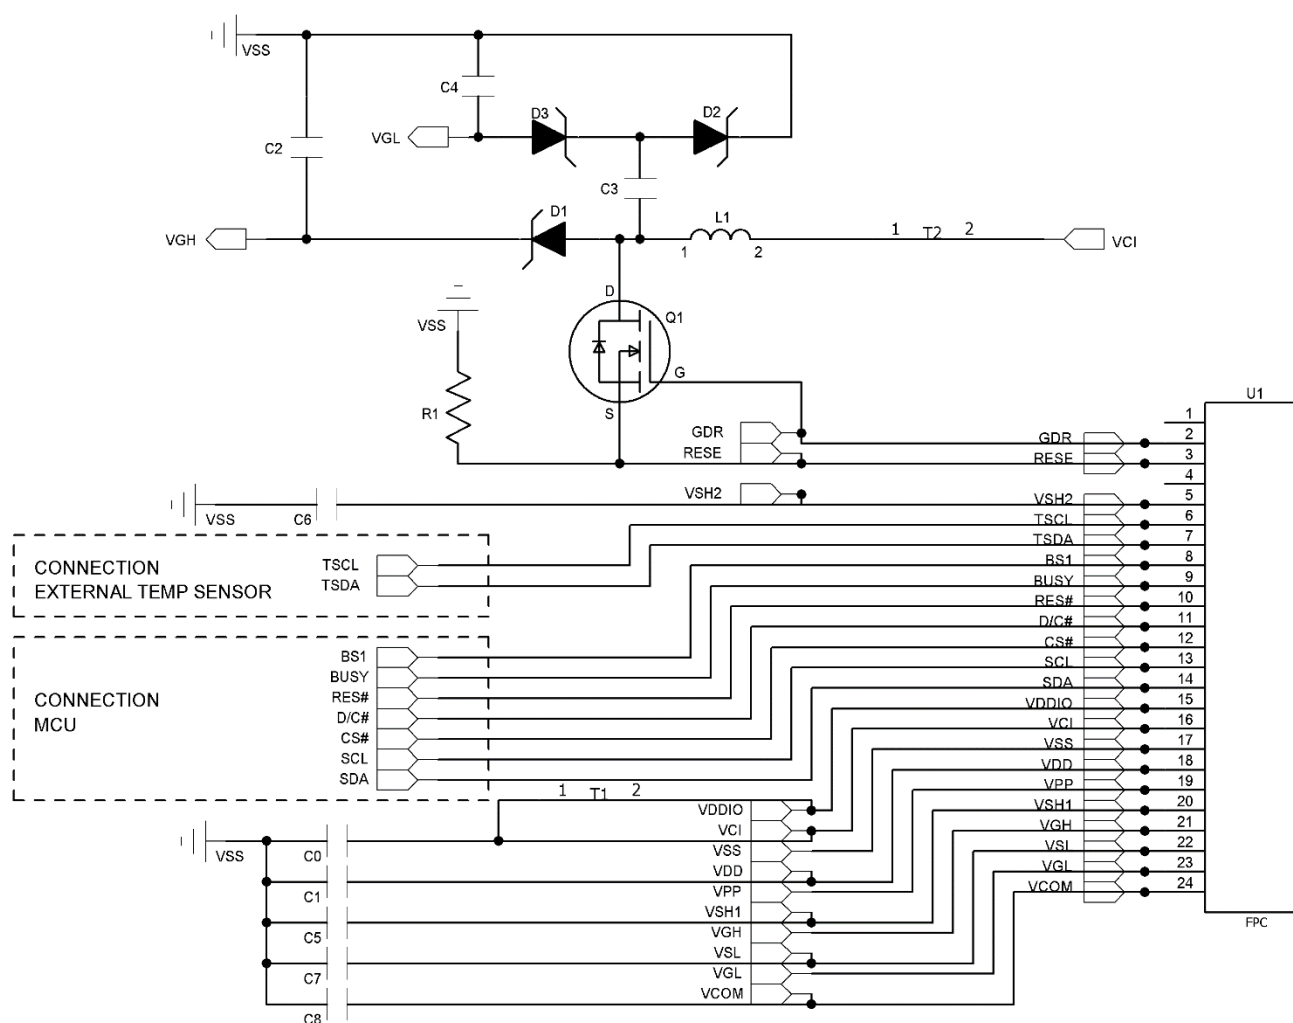

Table 13-1: Component list for SSD1683 application circuit

Part Name	Value	Requirements/Reference Part
C0-C1	1uF	X5R/X7R; Voltage Rating : 6V or 25V
C2-C7	1uF	0603/0805; X5R/X7R; Voltage Rating : 25V
C8	1uF	0603/0805; X7R; Voltage Rating : 25V
R1	2.2 ohm	0603/0805; 1% variation, $\geq 0.05W$
D1-D3	Diode	MBR0530 1) Reverse DC voltage $\geq 30V$ 2) $I_o \geq 500mA$ 3) Forward voltage $\leq 430mV$
Q1	NMOS	Si1304BDL/NX3008NBK 1) Drain-Source breakdown voltage $\geq 30V$ 2) $V_{gs(th)} = 0.9V$ (Typ), $1.3V$ (Max) 3) $R_{ds\ on} \leq 2.1\Omega$ @ $V_{gs} = 2.5V$
L1	47uH	CDRH2D18 / LDNP-470NC $I_o = 500mA$ (Max)
U1	0.5mm ZIF socket	24pins, 0.5mm pitch

Remarks:

- 1) The recommended component value and reference part in Table 13-1 is subject to change depending on panel loading.
- 2) Customer is required to review if the selected component value and part is suitable for their application.
